

The background features several large, stylized geometric shapes in the corners. In the top-left, there is a dark gray triangle pointing down and to the right, outlined in white. In the top-right, a dark gray triangle points down and to the left, also outlined in white. In the bottom-left, a dark gray triangle points up and to the right. In the bottom-right, a dark gray triangle points up and to the left. Additionally, there are lighter gray shapes: a triangle pointing right on the left edge and a triangle pointing up on the bottom edge.

JavaScript Introduction

Introduction JavaScript

- JavaScript:
 - ↳ is a scripting language.
 - ↳ Was developed by Netscape Corporation.
 - ↳ In the year 1995.
 - ↳ Was called Live Script Language.
 - ↳ Developed for Web applications.
 - ↳ In web application it is used at client side so it is also known as 'client side scripting language' (it works at client machine and doesn't affect the web server).
 - ↳ Is used to control or provide additional functionality to the client while working with the web application.

➤ JavaScript:

- ↳ Is used with HTML markup language / embedded with markup language.
- ↳ This language is always used with HTML.
- ↳ It is interpreted by browser and the browser will give response on client machine.
- ↳ The syntax of JavaScript is similar to programming language so it is easy to understand.

Content for JavaScript Introduction

Understanding JavaScript

02.

About Dynamic HTML

03.

HTML and JavaScript

01. Understanding JavaScript

- To understand JavaScript need to know the rules of
 - programming language and
 - markup language
- JavaScript also follows some rules to work with webpages.
- It is client side scripting language so it will be interpreted on client machine by any web browser.
- JavaScript is completely different than Java. It is a scripting language which allows some complex features in HTML and make it dynamic and interactive.

02. Dynamic HTML

- In Dynamic HTML each elements of webpage work as an object. Netscape called it HTML object.
- It makes the webpage more animated and interactive.
- It is the combination of HTML, CSS, JavaScript and JQuery.
- DHTML allows the following functionalities:
 - Animated Text and Image
 - Moving different HTML elements individually on their places.
 - User side restriction to fill form.
 - Binding one element with another elements.
 - Include drop down menu or roll-over menu.
 - Show, Hide and Toggle the Elements on some events.

03. HTML and JavaScript

- JavaScript is a scripting language. That is the code is not compiled but it appears as ASCII text in HTML file.
- There are three possibilities to integrate the JavaScript code into the HTML file.
 1. Integrating under the <head> tag.
 2. Integrating under the <body> tag.
 3. Importing the External JavaScript.

Integrating Script under the <head> tag

- JavaScript in the HTML file integrated under <head> tag will be executed immediately while the web page loads into the web browser, before anyone uses it.

- **Syntax:**

```
<html>
    <head>
        <script type = "text/javascript">
            .....
        </script>
    </head>
    <body>
        </body>
</html>
```

Integrating Script under the <body> tag

- JavaScript in the HTML file integrated under <body> tag will be executed when the web page loads and goes in the body section

- **Syntax:**

```
<html>
    <head>
    </head>
    <body>
        <script type = "text/javascript">
        .....
        </script>
    </body>
</html>
```

Importing the External Java Script

- Save the external JavaScript file with a .js extension.
- The external JavaScript cannot contain the <script> tag.
 - **Syntax:**

```
<html>  
    <head>  
        <script src="demo.js">  
    </head>  
    <body>  
  
    </body>  
</html>
```

Sample Code

```
<html>
```

```
<head>
```

```
<title>JavaScript</title>
```

```
<script type="text/javascript">
```

```
    document.write("Hello World");
```

```
</script>
```

```
</head>
```

```
<body>
```

```
</body>
```

```
</html>
```
